AN 2004179241 MEDLINE  
TI Intraurethral muscle-derived cell injections increase leak point pressure  
in a rat model of intrinsic sphincter deficiency.  
SO Urology, (2004 Apr) 63 (4) 780-5.  
Journal code: 0366151. ISSN: 1527-9995.  
AU Chermansky Christopher J; Tarin Tatum; Kwon Dong-Duek; Jankowski Ronald J;  
Cannon Tracy W; de Groat William C; Huard Johnny; **Chancellor Michael B**  
AB OBJECTIVES: To determine whether allogenic muscle-derived cells (MDCs)  
could restore sphincter function in rats with intrinsic sphincter  
deficiency (ISD). ISD denotes a malfunction of the urethral sphincter.  
METHODS: ISD was produced in 25 adult female Sprague-Dawley rats by  
cauterizing tissues lateral to the mid-urethra. One week after  
cauterization, 1.5 x 10(6) MDCs, genetically engineered for  
beta-galactosidase expression, was injected into the mid-urethra in 16  
rats. Another 9 rats were injected with Hanks' balanced salt solution  
after cauterization. As a control, 9 normal rats underwent a sham  
operation. Sphincter function was studied using the vertical tilt  
table/intravesical pressure clamp technique to measure leak point  
pressures (LPPs). The fate of the MDCs was assessed using LacZ staining.  
RESULTS: The injection of MDCs increased the LPP without affecting bladder  
function. The mean LPP of the control rats 2, 4, and 6 weeks after the  
sham operation was 49.8 +/- 1.3, 51.2 +/- 1.5, and 51.6 +/- 2.0 cm H2O,  
respectively. The mean LPP of the rats 2, 4, and 6 weeks after  
cauterization and Hanks' balanced salt solution injection was 17.2 +/-  
1.4, 26.9 +/- 1.9, and 25.5 +/- 1.3 cm H2O, respectively. The mean LPP of  
the rats 2, 4, and 6 weeks after cauterization and MDC injection was 38.2  
+/- 2.2, 43.1 +/- 2.6, and 51.5 +/- 0.9 cm H2O, respectively. LacZ  
staining confirmed that MDC had integrated within the striated muscle  
layer of the cauterized urethra. CONCLUSIONS: The injection of  
intraurethral MDCs improved sphincter function in rats with ISD and may  
provide an attractive alternative to current treatments.

TI Improved sphincter contractility after allogenic muscle-derived progenitor  
cell injection into the denervated rat urethra.  
SO Urology, (2003 Nov) 62 (5) 958-63.  
Journal code: 0366151. ISSN: 1527-9995.  
AU Cannon Tracy W; Lee Ji Youl; Somogyi George; Pruchnic Ryan; Smith  
Christopher P; Huard Johnny; **Chancellor Michael B**

AB OBJECTIVES: To study the physiologic outcome of allogenic transplant of muscle-derived progenitor cells (MDPCs) in the denervated female rat urethra. METHODS: MDPCs were isolated from muscle biopsies of normal 6-week-old Sprague-Dawley rats and purified using the preplate technique. Sciatic nerve-transected rats were used as a model of stress **urinary incontinence**. The experimental group was divided into three subgroups: control, denervated plus 20 microL saline injection, and denervated plus allogenic MDPCs (1 to 1.5 x 10<sup>6</sup>) cells) injection. Two weeks after injection, urethral muscle strips were prepared and underwent electrical field stimulation. The pharmacologic effects of d-tubocurarine, phentolamine, and tetrodotoxin on the urethral strips were assessed by contractions induced by electrical field stimulation. The urethral tissues also underwent immunohistochemical staining for fast myosin heavy chain and CD4-activated lymphocytes. RESULTS: Urethral denervation resulted in a significant decrease of the maximal fast-twitch muscle contraction amplitude to only 8.77% of the normal urethra and partial impairment of smooth muscle contractility. Injection of MDPCs into the denervated sphincter significantly improved the fast-twitch muscle contraction amplitude to 87.02% of normal animals. Immunohistochemistry revealed a large amount of new skeletal muscle fiber formation at the injection site of the urethra with minimal inflammation. CD4 staining showed minimal lymphocyte infiltration around the MDPC injection sites. CONCLUSIONS: Urethral denervation resulted in near-total abolishment of the skeletal muscle and partial impairment of smooth muscle contractility. Allogenic MDPCs survived 2 weeks in sciatic nerve-transected urethra with minimal inflammation. This is the first report of the restoration of deficient urethral sphincter function through muscle-derived progenitor cell tissue engineering. MDPC-mediated cellular urethral myoplasty warrants additional investigation as a new method to treat stress **urinary incontinence**.

 TI Current and future pharmacological treatment for overactive bladder.  
 SO Journal of urology, (2002 Nov) 168 (5) 1897-913. Ref: 176  
 Journal code: 0376374. ISSN: 0022-5347.  
 AU Yoshimura Naoki; Chancellor Michael B  
 AB PURPOSE: **Urinary incontinence** and overactive bladder are important and common conditions that have received little general medical attention. We reviewed the magnitude and impact of these conditions, and discuss pharmacotherapy as well as new drugs under investigation. MATERIALS AND METHODS: The main emphasis of this review is pharmacological therapy for the bladder. We discuss currently available agents, drugs under development and pharmacological targets that would be suitable targets for treating overactive bladder. Drugs such as duloxetine that target not bladder smooth muscle, but rather central nervous system control of the micturition reflex are undergoing clinical trials. We also discuss intravesical therapy and alternative drug delivery methods, such as intravesical capsaicin and botulinum toxin, with special emphasis on approaches to modulate bladder afferent nerve function for preventing overactive bladder. RESULTS: There are many advantages to advanced drug delivery systems, including long-term therapeutic efficacy, decreased side effects and improved patient compliance. Future speculation such as gene therapy holds great promise for overactive bladder because it is possible to access all genitourinary organs via endoscopy and other minimally invasive techniques that are ideally suited for gene therapy. CONCLUSIONS: Traditional anticholinergic therapies are limited in their effectiveness. There is great hope for future research regarding voiding dysfunction and **urinary incontinence** through a focus on afferent nerve intervention for preventing overactive bladder.

AB The present invention provides muscle-derived progenitor cells that show long-term survival following transplantation into body tissues and which can augment soft tissue following introduction (e.g. via injection, transplantation, or implantation) into a site of soft tissue. Also provided are methods of isolating muscle-derived progenitor cells, and methods of genetically modifying the cells for gene transfer therapy. The invention further provides methods of using compns. comprising muscle-derived progenitor cells for the augmentation and bulking of mammalian, including human, soft tissues in the treatment of various cosmetic or functional conditions, including malformation, injury, weakness, disease, or dysfunction. In particular, the present invention provides treatments and amelioration for dermatol. conditions, gastroesophageal reflux, vesico-ureteral reflux, **urinary incontinence**, fecal incontinence, heart failure, and myocardial infarction.
